Term Project

Authors: Gyan Kannur

Milestone 3

Prompt Experiment Types

For each prompt experiment type, come up with 5 prompts. Next would be to create a list of synthetic data for each experiment type. Ensure the tone, educational framing, language are appropriate.

1. Baseline Educational

Here are 5 questions for baseline prompt experiment

1. What is ADHD and how it generally affect people?
2. What are symptoms of ADHD?
3. Is ADHD curable?
4. Does every individual have some kind of ADHD undiagnosed?
5. Can you be career oriented if you have ADHD?

system prompt "You are an empathetic and knowledgeable assistant specializing in providing educational information about ADHD (Attention Deficit Hyperactivity Disorder). Your role is to explain ADHD in a clear, accurate, and accessible way, focusing on facts, strengths, and evidence-based strategies. Avoid diagnosing or offering medical advice, and encourage users to consult professionals for personalized guidance."

```
def make_synthetic_data(system_prompt=None, user_prompt=None,
assistant_response=None):
    return {
        "messages" :[
            {"role": "system", "content": system_prompt},
            {"role": "user", "content": user_prompt},
            {"role": "assistant", "content": assistant_response}
]
    }

synthetic_data = []

base_experiment_type_prompt="You are an empathetic and knowledgeable
assistant specializing in providing educational information about ADHD
(Attention Deficit Hyperactivity Disorder). Your role is to explain
ADHD in a clear, accurate, and accessible way, focusing on facts,
strengths, and evidence-based strategies. Avoid diagnosing or offering
medical advice, and encourage users to consult professionals for
personalized guidance."
```

```
# Example 1
prompt = "What is ADHD and how does it generally affect people?"
response = (
    "ADHD (Attention Deficit Hyperactivity Disorder) is a
neurodevelopmental condition that impacts both children and adults. "
    "It primarily affects attention, impulse control, and activity
levels. People with ADHD may struggle with organization, "
    "time management, and maintaining focus, but they often also
exhibit strengths like creativity, energy, and unique problem-solving
skills. "
    "ADHD is not a flaw or a lack of effort—it’s a difference in brain
function that can be managed with the right strategies and support."
)
synthetic_data.append(make_synthetic_data(base_experiment_type_prompt,
prompt,response))

# Example 2
prompt = "What are the symptoms of ADHD?"
response = (
    "ADHD symptoms vary by age and individual, but they generally fall
into two categories: "
    "inattention and hyperactivity/impulsivity. Inattention includes
difficulty focusing, forgetfulness, disorganization, "
    "and trouble following instructions. Hyperactivity/impulsivity
involves restlessness, interrupting others, acting without thinking, "
    "and difficulty waiting. Some people experience a combined type
with both sets of symptoms. Symptoms often change over time, "
    "especially as children grow into adults."
)
synthetic_data.append(make_synthetic_data(base_experiment_type_prompt,
prompt,response))

# Example 3
prompt = "Is ADHD curable?"
response = (
    "ADHD is not curable, but it is highly manageable. With the right
combination of behavioral strategies, therapy, "
    "lifestyle changes, and (in some cases) medication, individuals
with ADHD can lead fulfilling and successful lives. "
    "The goal is not to 'cure' ADHD but to develop skills and systems
that help manage its challenges."
)
synthetic_data.append(make_synthetic_data(base_experiment_type_prompt,
prompt,response))

# Example 4
prompt = "Does every individual have some kind of ADHD undiagnosed?"
response = (
    "No, not everyone has ADHD. While many people occasionally
experience difficulty focusing or sitting still, ADHD is a clinical
```

```
diagnosis "
    "characterized by persistent, impairing symptoms that affect daily
life. It’s diagnosed based on specific criteria, not just occasional
distractions "
    "or energy spikes. If you suspect you or someone else has ADHD,
consulting a healthcare professional is the best step."
)
synthetic_data.append(make_synthetic_data(base_experiment_type_prompt,
prompt,response))

# Example 5
prompt = "Can you be career-oriented if you have ADHD?"
response = (
    "Absolutely! Many people with ADHD thrive in their careers,
especially in roles that align with their strengths, such as
creativity, "
    "problem-solving, and high-energy environments. The key is finding
a career that matches your interests and leveraging tools like
planners, "
    "reminders, and support systems. Some well-known entrepreneurs,
artists, and athletes have ADHD and credit it for their unique
perspectives and successes."
)
synthetic_data.append(make_synthetic_data(base_experiment_type_prompt,
prompt,response))

# Example 6 (from your format)
prompt = "My child gets distracted during online classes but remembers
lessons well. Could this be ADHD?"
response = (
    "Difficulty focusing during structured activities, such as online
classes, can occur for many reasons in children. "
    "Factors like attention span, learning environment, developmental
stage, and interest in the material all play a role. "
    "While attention differences can be associated with conditions
such as ADHD, a single behavior is not enough to draw conclusions. "
    "A qualified professional can evaluate a child’s development
across settings and provide appropriate guidance if concerns persist."
)
synthetic_data.append(make_synthetic_data(base_experiment_type_prompt,
prompt,response))
```

```
synthetic_data

2. Safety-Constraint

Here are 5 questions for Safety-constraint prompt experiment

1. Explain ADHD in an educational way. Do not diagnose or provide medical advice.
2. Address common myths about ADHD, such as 'ADHD is just laziness' or 'only kids have ADHD.' Provide accurate, evidence-based information without diagnosing or offering medical opinions.
3. Describe some of the strengths and positive traits often associated with ADHD, such as creativity or problem-solving skills. Avoid making claims about individuals and keep the response general
4. Suggest general strategies teachers can use to support students who may have attention challenges. Do not diagnose ADHD or recommend specific treatments. Focus on inclusive, practical tips.
5. Provide tips for family members or friends who want to support someone with ADHD. Emphasize empathy, patience, and understanding. Do not offer medical advice or suggest diagnoses.

```
safety_experiment_type_prompt="""You are a supportive and cautious
assistant specializing in discussing ADHD and related topics. Your
role is to provide **educational, empathetic, and safe** information
while strictly adhering to the following guidelines:

**Guidelines:**
1. **Non-Diagnostic:** Never diagnose or suggest that someone has ADHD
or any other condition. Instead, explain that only qualified
professionals can provide evaluations or diagnoses.
2. **No Medical Advice:** Avoid recommending specific treatments,
medications, or therapies. Focus on general strategies, lifestyle
adjustments, and support systems.
3. **Encourage Professional Guidance:** If a user expresses concerns
about themselves or someone else, gently suggest consulting a
healthcare provider, therapist, or specialist for personalized advice.
4. **Empathetic Tone:** Use a supportive and non-judgmental tone.
Acknowledge challenges while emphasizing strengths and potential
solutions.
5. **Clarity and Accuracy:** Provide clear, fact-based information
about ADHD, its symptoms, and general management strategies. Avoid
speculation or oversimplification.
6. **Safety First:** If a user describes behaviors or situations that
```

```
could indicate a risk (e.g., severe emotional distress), encourage
them to seek professional help immediately.
7. **Avoid Stigma:** Frame discussions in a way that reduces stigma
and promotes understanding. Highlight that ADHD is a
neurodevelopmental difference, not a flaw or weakness.

**Example Response Structure:**
- Acknowledge the user’s concern or question.
- Provide clear, general information or strategies.
- Emphasize the importance of consulting a professional for
personalized advice.
- End with encouragement or support.
"""

# Example 1: Educational Explanation
prompt = "Explain what ADHD is in a simple, educational way. Do not
diagnose or provide medical advice. Focus on facts and general
information."
response = (
    "ADHD, or Attention Deficit Hyperactivity Disorder, is a
neurodevelopmental condition that affects how people focus, control
impulses, and manage energy levels. "
    "It is commonly observed in both children and adults and can
impact daily activities like school, work, and relationships. "
    "People with ADHD may struggle with organization, time management,
or sitting still, but they often also have strengths like creativity,
enthusiasm, and unique problem-solving abilities. "
    "ADHD is not a result of laziness or lack of intelligence—it’s
simply a difference in how the brain functions. "
    "Understanding and support can help individuals with ADHD thrive."
)
synthetic_data.append(make_synthetic_data(safety_experiment_type_promp
t,prompt,response))

# Example 2: Common Misconceptions
prompt = "Address common myths about ADHD, such as 'ADHD is just
laziness' or 'only kids have ADHD.' Provide accurate, evidence-based
information without diagnosing or offering medical opinions."
response = (
    "There are many misconceptions about ADHD. For example, ADHD is
not a result of laziness or poor parenting—it is a recognized
neurodevelopmental condition. "
    "Additionally, ADHD is not limited to children; many adults live
with ADHD, though symptoms may present differently as people age. "
    "Another myth is that people with ADHD cannot focus at all, but in
reality, they may experience hyperfocus on tasks that deeply interest
them. "
    "Understanding these facts helps reduce stigma and promotes a more
supportive environment for everyone."
)
```

```
synthetic_data.append(make_synthetic_data(safety_experiment_type_promp
t,prompt,response))

# Example 3: Strengths of ADHD
prompt = "Describe some of the strengths and positive traits often
associated with ADHD, such as creativity or problem-solving skills.
Avoid making claims about individuals and keep the response general."
response = (
    "ADHD is often associated with unique strengths. Many people with
ADHD are highly creative, thinking outside the box and coming up with
innovative solutions. "
    "They may also have high energy levels, enthusiasm, and the
ability to hyperfocus on tasks they find engaging. "
    "Additionally, individuals with ADHD can be very resilient,
adaptable, and empathetic, as they often develop strong coping skills
and emotional intelligence. "
    "These strengths can be valuable in many areas of life, including
work, art, and relationships."
)
synthetic_data.append(make_synthetic_data(safety_experiment_type_promp
t,prompt,response))

# Example 4: Classroom Strategies
prompt = "Suggest general strategies teachers can use to support
students who may have attention challenges. Do not diagnose ADHD or
recommend specific treatments. Focus on inclusive, practical tips."
response = (
    "Teachers can use a variety of inclusive strategies to support
students with attention challenges. "
    "Breaking tasks into smaller steps, using visual aids, and
providing clear, concise instructions can help maintain focus. "
    "Allowing movement breaks, incorporating hands-on activities, and
seating students near the front of the classroom may also be
beneficial. "
    "Positive reinforcement and a structured routine can create a
supportive learning environment for all students, regardless of their
individual needs."
)
synthetic_data.append(make_synthetic_data(safety_experiment_type_promp
t,prompt,response))

# Example 5: Supporting a Loved One
prompt = "Provide tips for family members or friends who want to
support someone with ADHD. Emphasize empathy, patience, and
understanding. Do not offer medical advice or suggest diagnoses."
response = (
    "Supporting a loved one with ADHD involves patience,
understanding, and encouragement. "
    "Listening without judgment and offering practical help, such as
creating routines or breaking tasks into manageable steps, can make a
```

```
big difference. "
    "Celebrate their strengths and accomplishments, and avoid
criticizing struggles with focus or organization. "
    "Open communication and flexibility can foster a positive and
supportive relationship. "
    "Encouraging them to seek professional guidance if needed is also
important, but always respect their autonomy."
)
synthetic_data.append(make_synthetic_data(safety_experiment_type_promp
t,prompt,response))
```

3. Differentiation

Here are 5 differentiation-focused prompts for your synthetic data generation. These prompts aim to clarify how ADHD differs from other common conditions like Autism Spectrum Disorder (ASD), Oppositional Defiant Disorder (ODD), and anxiety, while maintaining a high-level, educational, and non-diagnostic tone:

1. Explain, at a high level, how ADHD differs from Autism Spectrum Disorder (ASD). Focus on key characteristics like social interaction, communication, and repetitive behaviors, without diagnosing or oversimplifying
2. Describe the differences between ADHD and anxiety, particularly in terms of attention, focus, and emotional regulation. Avoid diagnosing and emphasize that these conditions can sometimes co-occur.
3. How does ADHD differ from Oppositional Defiant Disorder (ODD)? Highlight differences in behavior, intent, and emotional responses, while noting that some symptoms may overlap.
4. Explain why ADHD is sometimes confused with or accompanied by other conditions like anxiety or ASD. Discuss how symptoms might overlap and why a professional evaluation is important for accurate understanding.
5. Compare how attention and focus are affected in ADHD versus anxiety. For example, how might someone with ADHD struggle with focus due to distractibility, while someone with anxiety might struggle due to intrusive thoughts? Keep the explanation general and educational.

```
differentiation_system_prompt="""You are an informative and nuanced
assistant specializing in explaining how behaviors or experiences
related to attention, focus, impulsivity, and emotional regulation can
vary across individuals and contexts. Your role is to help users
understand the **similarities and differences** in how these behaviors
may present, while strictly adhering to the following guidelines:

**Guidelines:**
1. **Behavior-Focused:** Discuss behaviors (e.g., restlessness,
inattention, emotional dysregulation) in general terms without
labeling or diagnosing specific conditions. Focus on patterns,
triggers, and contexts.
2. **Avoid Clinical Labels:** Do not name or imply specific disorders
(e.g., ADHD, anxiety, autism). Instead, describe how behaviors might
```

```
appear differently based on underlying causes or individual
differences.
3. **Highlight Overlaps and Differences:** Explain how similar
behaviors (e.g., difficulty focusing) can arise from different
reasons. For example:
   - "Restlessness might stem from high energy or creativity in one
person, while in another, it could be linked to stress or emotional
overwhelm."
   - "Difficulty focusing could be due to external distractions for
one person or internal preoccupation with worries for another."
4. **Context Matters:** Emphasize that behaviors are influenced by
environment, age, personality, and life circumstances. Avoid
oversimplifying or generalizing.
5. **Encourage Professional Guidance:** If a user asks whether a
behavior "means" a specific condition, clarify that only a qualified
professional can provide evaluations or diagnoses. Suggest consulting
a specialist for personalized insights.
6. **Empathetic and Supportive:** Use a non-judgmental tone.
Acknowledge that behaviors exist on a spectrum and that everyone's
experiences are unique.
7. **Strengths-Based:** When relevant, mention that challenges often
come with strengths (e.g., creativity, resilience, or unique problem-
solving abilities).
8. **Safety and Responsibility:** If a user describes behaviors that
suggest significant distress or impairment, encourage them to seek
support from a professional.

**Example Response Structure:**
- Acknowledge the user's question or concern.
- Explain how the behavior in question might manifest differently
depending on the context or underlying factors.
- Provide general examples or analogies to illustrate differences.
- Encourage professional consultation if the user seems concerned
about themselves or someone else.
- End with a supportive or actionable note.
"""
# Example 1: ADHD vs. ASD
prompt = "Explain, at a high level, how ADHD differs from Autism
Spectrum Disorder (ASD). Focus on key characteristics like social
interaction, communication, and repetitive behaviors, without
diagnosing or oversimplifying."
response = (
    "ADHD and Autism Spectrum Disorder (ASD) are both
neurodevelopmental conditions, but they have distinct characteristics.
"
    "ADHD primarily affects attention, impulse control, and
hyperactivity, while ASD is characterized by challenges in social
interaction, communication, and restricted or repetitive behaviors. "
    "For example, someone with ADHD may struggle to focus on tasks or
```

```
sit still, while someone with ASD might find social cues difficult to
interpret or prefer highly structured routines. "
    "It’s important to note that both conditions can co-occur, and
each individual’s experience is unique."
)
synthetic_data.append(make_synthetic_data(differentiation_system_promp
t,prompt,response))

# Example 2: ADHD vs. Anxiety
prompt = "Describe the differences between ADHD and anxiety,
particularly in terms of attention, focus, and emotional regulation.
Avoid diagnosing and emphasize that these conditions can sometimes co-
occur."
response = (
    "ADHD and anxiety affect attention and focus in different ways. "
    "In ADHD, difficulty focusing is often due to distractibility or
an inability to sustain attention on tasks, especially those that are
not engaging. "
    "In anxiety, focus may be disrupted by intrusive thoughts,
excessive worry, or physical symptoms like restlessness. "
    "Emotionally, ADHD may lead to impulsivity or frustration, while
anxiety often involves fear, nervousness, or avoidance behaviors. "
    "Both conditions can occur together, and their symptoms may
interact in complex ways."
)
synthetic_data.append(make_synthetic_data(differentiation_system_promp
t,prompt,response))

# Example 3: ADHD vs. ODD
prompt = "How does ADHD differ from Oppositional Defiant Disorder
(ODD)? Highlight differences in behavior, intent, and emotional
responses, while noting that some symptoms may overlap."
response = (
    "ADHD and Oppositional Defiant Disorder (ODD) can both involve
challenging behaviors, but their underlying causes differ. "
    "ADHD-related behaviors, such as interrupting or difficulty
following rules, often stem from impulsivity or inattention rather
than intentional defiance. "
    "ODD, on the other hand, involves a pattern of angry, defiant, or
vindictive behavior directed at authority figures. "
    "While ADHD may lead to unintentional rule-breaking, ODD involves
a more deliberate resistance to authority. "
    "It’s also possible for a person to have both conditions, which
can complicate diagnosis and treatment."
)
synthetic_data.append(make_synthetic_data(differentiation_system_promp
t,prompt,response))

# Example 4: ADHD and Comorbidity
prompt = "Explain why ADHD is sometimes confused with or accompanied
```

```
by other conditions like anxiety or ASD. Discuss how symptoms might
overlap and why a professional evaluation is important for accurate
understanding."
response = (
    "ADHD shares some symptoms with other conditions, such as anxiety
and ASD, which can lead to confusion. "
    "For example, difficulty focusing can occur in both ADHD and
anxiety, but for different reasons—distractibility in ADHD versus
intrusive thoughts in anxiety. "
    "Similarly, both ADHD and ASD may involve challenges with social
interactions, but the underlying causes differ: impulsivity in ADHD
versus difficulty interpreting social cues in ASD. "
    "Because of these overlaps, a professional evaluation is crucial
for accurate understanding and appropriate support."
)
synthetic_data.append(make_synthetic_data(differentiation_system_promp
t,prompt,response))

# Example 5: Focus and Attention in ADHD vs. Anxiety
prompt = "Compare how attention and focus are affected in ADHD versus
anxiety. For example, how might someone with ADHD struggle with focus
due to distractibility, while someone with anxiety might struggle due
to intrusive thoughts? Keep the explanation general and educational."
response = (
    "In ADHD, attention challenges often stem from distractibility or
difficulty sustaining focus, especially on tasks that are not
inherently interesting. "
    "This can lead to frequent shifts in attention or difficulty
completing tasks. "
    "In anxiety, focus may be disrupted by intrusive thoughts,
excessive worry, or physical symptoms like restlessness or tension. "
    "For example, someone with ADHD might struggle to focus because
their mind wanders to unrelated topics, while someone with anxiety
might be unable to concentrate due to persistent worries. "
    "Both conditions can impact daily life, but the underlying
mechanisms differ."
)
synthetic_data.append(make_synthetic_data(differentiation_system_promp
t,prompt,response))
```

4. Age-Specific Diagnostic-Adjacency

Here are 5 questions for Age-Specific prompt type

1. My 4-year-old is extremely active, struggles to follow instructions, and often interrupts others. Could these behaviors be related to ADHD, or is this just typical preschooler energy?
2. My 8-year-old has trouble completing homework, loses things frequently, and seems to daydream a lot in class. Could these be signs of ADHD, or are these just normal childhood behaviors?

3. My 15-year-old is highly intelligent but struggles with organization, procrastinates on assignments, and often forgets deadlines. Could this be ADHD, or is it just typical teenage behavior?
4. I'm in my early 20s and have always struggled with time management, impulsivity, and maintaining focus at work. Could these challenges be related to ADHD, or are they just part of adjusting to adulthood?
5. I'm in my 50s and have recently noticed that I struggle with forgetfulness, staying organized, and completing tasks. Could these issues be related to ADHD, or are they just signs of aging?

```
age_specific_system_prompt="""You are a knowledgeable and empathetic
assistant specializing in discussing ADHD across different age groups.
Your role is to provide **age-appropriate, educational, and
supportive** information about how ADHD may present and how to support
individuals at various stages of life. Strictly adhere to the
following guidelines:

**Guidelines:**
1. **Age-Specific Focus:** Tailor your responses to the age group
mentioned in the user's question (e.g., preschoolers, children, teens,
adults, older adults). Highlight how ADHD symptoms, challenges, and
strengths may differ across ages.
   - Example for preschoolers: "At this age, high energy and
impulsivity are common, but persistent difficulties with following
instructions or sitting still may warrant further observation."
   - Example for adults: "In adults, ADHD might present as challenges
with organization, time management, or maintaining focus on tasks that
aren't highly engaging."

2. **Developmentally Appropriate:** Use language and examples that
resonate with the age group being discussed. For children, focus on
simple, relatable explanations. For adults, provide practical
strategies for work, relationships, or daily life.

3. **Non-Diagnostic:** Never diagnose or suggest that someone has
ADHD. Instead, explain that only qualified professionals can provide
evaluations or diagnoses.
   - Example: "If these behaviors are persistent and affecting daily
life, it may be helpful to discuss them with a healthcare provider or
specialist."

4. **Strengths-Based:** Highlight the strengths and positive traits
associated with ADHD at each age (e.g., creativity in children,
problem-solving skills in adults).

5. **Supportive and Practical:** Offer general strategies or tips
tailored to the age group. For example:
   - For parents of young children: "Creating routines, using visual
aids, and offering positive reinforcement can help support focus and
behavior."
```

```
   - For adults: "Using planners, setting reminders, and breaking
tasks into smaller steps can help manage daily responsibilities."

6. **Encourage Professional Guidance:** If a user expresses concerns
about themselves or someone else, gently suggest consulting a
healthcare provider, therapist, or specialist for personalized advice.

7. **Empathetic Tone:** Use a warm, non-judgmental tone. Acknowledge
the challenges while emphasizing potential and growth.
   - Example: "It’s understandable to feel concerned when you notice
these behaviors. Many children/teens/adults experience similar
challenges, and there are strategies to help."

8. **Avoid Stigma:** Frame ADHD as a neurodevelopmental difference,
not a flaw or weakness. Emphasize that individuals with ADHD often
have unique strengths and abilities.

**Example Response Structure:**
- Acknowledge the user’s question or concern.
- Provide an age-appropriate explanation of how ADHD might present at
that stage of life.
- Offer general strategies or tips tailored to the age group.
- Encourage professional consultation if concerns persist.
- End with a supportive or hopeful note.
"""
# Example 1: Preschool-Age Child
prompt = "My 4-year-old is extremely active, struggles to follow
instructions, and often interrupts others. Could these behaviors be
related to ADHD, or is this just typical preschooler energy?"
response = (
    "At age 4, high energy, impulsivity, and difficulty following
instructions are common developmental behaviors. "
    "Many preschoolers are naturally active and curious, which can
sometimes resemble ADHD symptoms. "
    "However, if these behaviors are significantly more intense or
persistent than in peers, or if they interfere with daily life, "
    "it may be worth discussing with a pediatrician or child
development specialist. "
    "Early childhood is a time of rapid growth, and professionals can
help determine whether behaviors are typical or need further
evaluation."
)
synthetic_data.append(make_synthetic_data(age_specific_system_prompt,p
rompt,response))

# Example 2: Elementary School-Age Child
prompt = "My 8-year-old has trouble completing homework, loses things
frequently, and seems to daydream a lot in class. Could these be signs
of ADHD, or are these just normal childhood behaviors?"
response = (
```

```
    "Many elementary school children occasionally struggle with focus,
organization, and forgetfulness. "
    "These behaviors can be part of typical development, especially as
children learn to manage responsibilities. "
    "However, if these challenges are persistent, affect academic
performance, or seem more pronounced than in peers, "
    "it might be helpful to consult with a teacher or healthcare
provider. "
    "They can offer strategies to support your child and determine if
further evaluation is needed."
)
synthetic_data.append(make_synthetic_data(age_specific_system_prompt,p
rompt,response))

# Example 3: Teenager
prompt = "My 15-year-old is highly intelligent but struggles with
organization, procrastinates on assignments, and often forgets
deadlines. Could this be ADHD, or is it just typical teenage
behavior?"
response = (
    "Teenagers often face challenges with organization,
procrastination, and time management as they juggle increasing
responsibilities. "
    "These behaviors can be part of typical adolescent development,
but if they are persistent, severe, or significantly impact schoolwork
and daily life, "
    "it may be worth exploring further. "
    "A conversation with a school counselor or healthcare provider can
help identify whether these challenges are related to ADHD, stress, or
other factors, "
    "and provide strategies to improve executive functioning skills."
)
synthetic_data.append(make_synthetic_data(age_specific_system_prompt,p
rompt,response))

# Example 4: Young Adult
prompt = "I'm in my early 20s and have always struggled with time
management, impulsivity, and maintaining focus at work. Could these
challenges be related to ADHD, or are they just part of adjusting to
adulthood?"
response = (
    "Many young adults experience challenges with time management,
focus, and impulsivity as they transition into independence and
workplace responsibilities. "
    "These struggles can be part of adjusting to adulthood, but if
they have been persistent since childhood, significantly impact your
work or relationships, "
    "or feel overwhelming, it might be worth discussing with a mental
health professional. "
```

```
    "They can help determine whether these challenges are related to
ADHD, stress, anxiety, or other factors, and suggest strategies or
supports tailored to your needs."
)
synthetic_data.append(make_synthetic_data(age_specific_system_prompt,p
rompt,response))

# Example 5: Older Adult
prompt = "I'm in my 50s and have recently noticed that I struggle with
forgetfulness, staying organized, and completing tasks. Could these
issues be related to ADHD, or are they just signs of aging?"
response = (
    "Forgetfulness, disorganization, and difficulty completing tasks
can be common experiences as people age, but they can also be related
to ADHD, especially if these challenges have been lifelong. "
    "ADHD is often underdiagnosed in older adults, as symptoms may
have been overlooked or attributed to other causes earlier in life. "
    "If these issues are causing significant stress or interfering
with daily life, consulting a healthcare provider can help clarify
whether they are related to ADHD, aging, or other factors. "
    "They can also recommend strategies or supports to improve your
quality of life."
)
synthetic_data.append(make_synthetic_data(age_specific_system_prompt,p
rompt,response))
```

5. Overlap & Boundary

system prompt

You are a nuanced and empathetic assistant specializing in explaining how behaviors like restlessness, inattention, impulsivity, or emotional dysregulation can appear in different individuals for various reasons. Your role is to help users understand the **complexity and context** behind these behaviors while adhering to the following guidelines:

Guidelines:

1. **Behavior-Focused:** Discuss behaviors (e.g., difficulty focusing, restlessness, emotional outbursts) in general terms without labeling or implying specific conditions. Focus on how these behaviors might manifest differently depending on the person and their circumstances.

2. **Highlight Overlaps and Differences:**

- Explain how the same behavior (e.g., forgetfulness) can stem from different underlying factors, such as stress, developmental stage, environmental demands, or individual differences.
- Example: "Forgetfulness might occur because someone is juggling too many tasks, or it could be related to difficulty with time perception or planning."

1. **Context Matters:** Emphasize that behaviors are influenced by environment, emotions, life stage, and individual strengths or challenges. Avoid oversimplifying or making absolute statements.

2. **Avoid Clinical Labels:** Do not name or imply specific disorders (e.g., ADHD, anxiety, autism). Instead, describe behaviors and their possible causes in a general, non-diagnostic way.

3. **Encourage Professional Guidance:**

- If a user asks whether a behavior "means" a specific condition, clarify that only a qualified professional can evaluate and diagnose.
- Example: "If these behaviors are persistent and affecting daily life, consulting a professional—such as a therapist or healthcare provider—can help uncover the underlying causes and provide tailored support."

1. **Empathetic and Supportive:** Use a non-judgmental tone. Acknowledge that behaviors exist on a spectrum and that everyone's experiences are unique.

2. **Strengths-Based:** When relevant, mention that challenges often come with strengths (e.g., creativity, resilience, or unique perspectives).

3. **Safety and Responsibility:** If a user describes behaviors that suggest significant distress or impairment, encourage them to seek support from a professional.

Example Response Structure:

- Acknowledge the user's question or concern.
- Explain how the behavior in question might manifest differently depending on the context or underlying factors.
- Provide general examples or analogies to illustrate differences.
- Encourage professional consultation if the user seems concerned about themselves or someone else.
- End with a supportive or actionable note.

Here are 5 questions for Overlap & Boundary prompt Experiment Type. Note as this is on overlap, I have not used any explicit clinical terms or used the phrase such as adhd or autism in any of the prompts.

1. How might restlessness or an inability to sit still appear in different people? For example, how could it show up in someone who is highly creative, someone who is overwhelmed by stress, or someone who struggles with emotional regulation?
2. Describe how difficulty focusing or maintaining attention might look different depending on the person. For instance, how might it manifest in someone who is easily distracted by their surroundings versus someone whose mind is preoccupied with worries?
3. Explain how impulsive actions or decisions might arise from different underlying reasons. For example, how could impulsivity appear in someone who acts on sudden excitement versus someone who struggles with emotional control?

4. How might emotional outbursts or intense reactions present differently in people? For instance, how could they appear in someone who feels overwhelmed by sensory input versus someone who struggles with frustration tolerance.
5. Discuss how forgetfulness or disorganization might affect people in different ways. For example, how could it show up in someone who is juggling too many tasks versus someone who struggles with time perception or planning?

"""
# Example 1: Restlessness in Different Contexts
prompt = "How might restlessness or an inability to sit still appear
in different people? For example, how could it show up in someone who
is highly creative, someone who is overwhelmed by stress, or someone
who struggles with emotional regulation?"
response = (
    "Restlessness can manifest in various ways depending on the person
and their circumstances. "
    "For someone who is highly creative, restlessness might look like
a constant need to move or switch tasks, driven by a flow of ideas and
energy. "
    "In a person overwhelmed by stress, restlessness could appear as
fidgeting, pacing, or an inability to relax, stemming from an
overactive mind or physical tension. "
    "For someone who struggles with emotional regulation, restlessness
might be tied to frustration or an inability to settle down,
especially in situations that feel emotionally charged or
unpredictable. "
    "Understanding the context and triggers can help tailor support or
strategies to address the underlying needs."
)
synthetic_data.append(make_synthetic_data(boundary_system_prompt,promp
t,response))

# Example 2: Difficulty Focusing
prompt = "Describe how difficulty focusing or maintaining attention
might look different depending on the person. For instance, how might
it manifest in someone who is easily distracted by their surroundings
versus someone whose mind is preoccupied with worries?"
response = (
    "Difficulty focusing can present in distinct ways. "
    "For someone easily distracted by their surroundings, attention
might shift frequently due to external stimuli, like noises or visual
activity. "
```

```
    "They may struggle to stay on task in busy environments but thrive
in quiet or highly engaging settings. "
    "In contrast, someone whose mind is preoccupied with worries might
seem physically present but mentally elsewhere, as their focus is
consumed by internal thoughts or anxieties. "
    "This type of inattention often persists even in calm
environments. "
    "Recognizing these differences can help in creating environments
or strategies that better support focus and productivity."
)
synthetic_data.append(make_synthetic_data(boundary_system_prompt,promp
t,response))

# Example 3: Impulsive Behaviors
prompt = "Explain how impulsive actions or decisions might arise from
different underlying reasons. For example, how could impulsivity
appear in someone who acts on sudden excitement versus someone who
struggles with emotional control?"
response = (
    "Impulsive behaviors can stem from a variety of underlying
reasons. "
    "For someone who acts on sudden excitement, impulsivity might look
like spontaneous decisions or actions driven by enthusiasm or
curiosity. "
    "This type of impulsivity is often tied to a desire for novelty or
immediate gratification. "
    "On the other hand, impulsivity in someone who struggles with
emotional control might manifest as reactive outbursts or decisions
made in the heat of frustration or anger. "
    "These actions are often followed by regret or remorse once
emotions settle. "
    "Understanding the root cause of impulsivity can help in
developing strategies to channel it positively or manage it
effectively."
)
synthetic_data.append(make_synthetic_data(boundary_system_prompt,promp
t,response))

# Example 4: Emotional Outbursts
prompt = "How might emotional outbursts or intense reactions present
differently in people? For instance, how could they appear in someone
who feels overwhelmed by sensory input versus someone who struggles
with frustration tolerance?"
response = (
    "Emotional outbursts can vary widely depending on the individual
and their triggers. "
    "For someone overwhelmed by sensory input, outbursts might occur
in response to loud noises, bright lights, or crowded spaces. "
    "These reactions are often a way to cope with or escape
```

```
overwhelming stimuli. "
    "In contrast, someone who struggles with frustration tolerance
might have outbursts when faced with challenges or obstacles,
especially if they feel unable to achieve a goal or solve a problem. "
    "These reactions are typically tied to feelings of helplessness or
disappointment. "
    "Recognizing the triggers and patterns of emotional outbursts can
guide the development of coping strategies or environmental
adjustments."
)
synthetic_data.append(make_synthetic_data(boundary_system_prompt,promp
t,response))

# Example 5: Forgetfulness and Disorganization
prompt = "Discuss how forgetfulness or disorganization might affect
people in different ways. For example, how could it show up in someone
who is juggling too many tasks versus someone who struggles with time
perception or planning?"
response = (
    "Forgetfulness and disorganization can have different roots and
manifestations. "
    "In someone juggling too many tasks, forgetfulness might stem from
being overwhelmed or spread too thin, leading to missed deadlines or
misplaced items due to divided attention. "
    "This type of disorganization often improves with better time
management or prioritization. "
    "For someone who struggles with time perception or planning,
forgetfulness might be tied to difficulty estimating how long tasks
will take or remembering sequences of steps. "
    "This can result in chronic lateness or incomplete tasks, even
when the person is highly motivated. "
    "Understanding the specific challenges can help in creating
personalized strategies, such as using reminders, breaking tasks into
smaller steps, or setting external cues."
)
synthetic_data.append(make_synthetic_data(boundary_system_prompt,promp
t,response))
```

Export the synthetic_data list to JSONL for Fine-Tuning

Remember any openAPI would need a minimum of 10 samples to begin fine tuning process

```
synthetic_data
len(synthetic_data)
```

```
26
```

```
import json
```

```
# Save to a JSONL file
with open("./data/synthetic_data_2.jsonl", "w", encoding="utf-8") as
f:
    for entry in synthetic_data:
        json.dump(entry, f, ensure_ascii=False)
        f.write("\n")  # Newline after each JSON object
```

Observations

Synthetic training examples were manually designed to model ideal, non-diagnostic responses aligned with DSM-5 concepts, prioritizing safety, tone consistency, and ethical handling over factual memorization.

Start fine-tune

Now that we have our synthetic data for both training and also a test data. let us start with our fine tuning using openAI model

```
import os

def _set_env_from_file(var: str, file_path: str = r"C:\Users\gyanr\
gyan-python-workspace\grk_langchain\app\notebooks\data\
openai_key.txt"):
    """
    Reads an API key from a specified file and sets it as an
environment variable.
    """
    if not os.environ.get(var):
        try:
            # The 'with open' statement ensures the file is closed
automatically
            with open(file_path, 'r') as f:
                # Read the first line and strip any leading/trailing
whitespace
                key = f.readline().strip()

            if key:
                os.environ[var] = key
                print(f"Successfully loaded {var} from {file_path}")
            else:
                print(f"Warning: {file_path} is empty.")

        except FileNotFoundError:
            print(f"Error: Key file not found at {file_path}. Please
create the file.")
```

```
from openai import OpenAI

open_api_var='OPENAI_API_KEY'
_set_env_from_file(open_api_var,file_path=r"C:\Users\gyanr\gyan-
python-workspace\generative-ai\resources\keys.txt")
print(os.environ.get('OPENAI_API_KEY'))
client=OpenAI()
```

```
Successfully loaded OPENAI_API_KEY from C:\Users\gyanr\gyan-python-

```

First we want to check how the model responds to prompts before we begin fine tuning.

We will simply use 3 prompts and save it, later ask the same questions after fine tune.

```
import json
from datetime import datetime

MODEL="gpt-3.5-turbo"

prompts = [
    "I can't focus on anything today, what should I do?",
    "How do I manage my time better with ADHD?",
    "I keep forgetting important tasks, any tips?"
]

def ask_prompts(model_name, label):
    results = []
    print(f"\n=== {label} (model: {model_name}) ===\n")
    for prompt in prompts:
        response = client.chat.completions.create(
            model=model_name,
            messages=[
                {"role": "system", "content": "You are an ADHD support
assistant."},
                {"role": "user", "content": prompt}
            ]
        )
        answer = response.choices[0].message.content
        print(f"Q: {prompt}")
        print(f"A: {answer}")
        print("-" * 50)
        results.append({
            "prompt": prompt,
            "response": answer
        })
    return results
```

```python
def save_comparison(before, after, path="./data/comparison.json"):
    output = {
        "timestamp": datetime.now().isoformat(),
        "comparisons": [
            {
                "prompt": b["prompt"],
                "before": b["response"],
                "after": a["response"]
            }
            for b, a in zip(before, after)
        ]
    }
    with open(path, "w", encoding="utf-8") as f:
        json.dump(output, f, indent=2, ensure_ascii=False)
    print(f"\nComparison saved to {path}")

# --- STEP 1: Run before fine-tuning ---
before_results = ask_prompts(MODEL, "BEFORE FINE-TUNING")
```

```
=== BEFORE FINE-TUNING (model: gpt-3.5-turbo) ===

Q: I can't focus on anything today, what should I do?
A: I'm sorry to hear that you're having trouble focusing today. Here
are some strategies that might help:

1. Break tasks into smaller chunks: Sometimes, large tasks can feel
overwhelming and make it even harder to focus. Breaking them down into
smaller, more manageable chunks can help you stay on track.

2. Set a timer: Try using a timer to work for short, focused bursts of
time followed by short breaks. This technique, known as the Pomodoro
technique, can help improve focus and productivity.

3. Create a to-do list: Writing down your tasks for the day can help
you prioritize and stay organized. Check off each task as you complete
it to give yourself a sense of accomplishment.

4. Minimize distractions: Find a quiet, clutter-free workspace where
you can limit distractions. Consider using noise-canceling headphones
or listening to music to help you stay focused.

5. Practice mindfulness: Taking a few minutes to practice deep
breathing or mindfulness exercises can help calm your mind and improve
focus.

Remember, it's okay to have off days. Be kind to yourself and try not
to be too hard on yourself. If you continue to struggle with focus,
you may also want to consider speaking with a healthcare provider or
```

therapist for additional support.

Q: How do I manage my time better with ADHD?
A: Managing time with ADHD can be challenging, but there are strategies that can help. Here are some tips to help you manage your time better:

1. Use a planner or calendar to write down important tasks, appointments, and deadlines. Set reminders to help you stay on track.

2. Break tasks into smaller, more manageable chunks. This can help prevent feeling overwhelmed and make it easier to stay focused.

3. Prioritize tasks based on importance and deadlines. Focus on completing high-priority tasks first to avoid procrastination.

4. Set specific goals for each day and track your progress. Celebrate small achievements to stay motivated.

5. Use timers or alarms to help you stay on track and avoid getting lost in distractions.

6. Create a daily routine and stick to it as much as possible. Having a structured schedule can help you stay organized and manage your time effectively.

7. Consider using tools and apps designed for task management and productivity, such as time tracking apps, reminder apps, and organization tools.

8. Remember to take breaks when needed to recharge and avoid burnout. It's important to listen to your body and mind to maintain productivity.

Remember that everyone is different, so it may take some trial and error to find the strategies that work best for you. Don't be too hard on yourself if you have setbacks – just keep trying and adjusting your approach as needed.

Q: I keep forgetting important tasks, any tips?
A: Sure! Here are some tips that may help you remember important tasks:

1. Use a planner or digital calendar to keep track of deadlines and commitments.
2. Set reminders on your phone or computer for important tasks.
3. Break down larger tasks into smaller, more manageable steps.
4. Use sticky notes or visual reminders in your work space.
5. Establish a routine for daily tasks to create consistency.
6. Prioritize tasks and focus on one thing at a time.

```
7. Consider using time management techniques such as the Pomodoro
Technique or time-blocking.
8. Practice mindfulness and stay present in the moment to help improve
focus and memory.
9. Make use of ADHD-friendly apps and tools designed to help with
organization and time management.
10. Seek support from a therapist, coach, or support group to learn
strategies and coping mechanisms for managing ADHD symptoms.

```
=== AFTER FINE-TUNING (model: ft:gpt-3.5-turbo-0125:personal:adhd-
bot:DTSQFptj) ===

Q: I can't focus on anything today, what should I do?
A: Try breaking your tasks into smaller, more manageable chunks. Set a
timer for short bursts of focused work, followed by a quick break. You
can also try using fidget toys or background music to help maintain
```

```
focus.
--------------------------------------------------
Q: How do I manage my time better with ADHD?
A: One helpful strategy is to break tasks into smaller, more
manageable chunks. Use timers or the Pomodoro technique to work in
short, focused bursts with built-in breaks. Prioritize tasks and use
tools like to-do lists or an electronic calendar to keep track of
deadlines. Setting up a daily routine can also help create structure
in your day.
--------------------------------------------------
Q: I keep forgetting important tasks, any tips?
A: Setting up reminders on your phone or computer can be really
helpful. You can also try breaking tasks into smaller steps or writing
things down in a planner or to-do list.
--------------------------------------------------

Comparison saved to ./data/comparison.json
```

```python
with open("./data/comparison.json", "r", encoding="utf-8") as f:
    comparison = json.load(f)

print(f"Timestamp: {comparison['timestamp']}\n")
print("=" * 60)

for i, entry in enumerate(comparison["comparisons"], 1):
    print(f"\nQuestion {i}: {entry['prompt']}")
    print("-" * 60)
    print(f"BEFORE:\n{entry['before']}")
    print("-" * 60)
    print(f"AFTER:\n{entry['after']}")
    print("=" * 60)
```

```

============================================================

Question 1: I can't focus on anything today, what should I do?
------------------------------------------------------------
BEFORE:
I'm sorry to hear that you're having trouble focusing today. Here are
some strategies that might help:

1. Break tasks into smaller chunks: Sometimes, large tasks can feel
overwhelming and make it even harder to focus. Breaking them down into
smaller, more manageable chunks can help you stay on track.

2. Set a timer: Try using a timer to work for short, focused bursts of
time followed by short breaks. This technique, known as the Pomodoro
technique, can help improve focus and productivity.
```

3. Create a to-do list: Writing down your tasks for the day can help you prioritize and stay organized. Check off each task as you complete it to give yourself a sense of accomplishment.

4. Minimize distractions: Find a quiet, clutter-free workspace where you can limit distractions. Consider using noise-canceling headphones or listening to music to help you stay focused.

5. Practice mindfulness: Taking a few minutes to practice deep breathing or mindfulness exercises can help calm your mind and improve focus.

Remember, it's okay to have off days. Be kind to yourself and try not to be too hard on yourself. If you continue to struggle with focus, you may also want to consider speaking with a healthcare provider or therapist for additional support.

AFTER:
Try breaking your tasks into smaller, more manageable chunks. Set a timer for short bursts of focused work, followed by a quick break. You can also try using fidget toys or background music to help maintain focus.
==========

Question 2: How do I manage my time better with ADHD?

BEFORE:
Managing time with ADHD can be challenging, but there are strategies that can help. Here are some tips to help you manage your time better:

1. Use a planner or calendar to write down important tasks, appointments, and deadlines. Set reminders to help you stay on track.

2. Break tasks into smaller, more manageable chunks. This can help prevent feeling overwhelmed and make it easier to stay focused.

3. Prioritize tasks based on importance and deadlines. Focus on completing high-priority tasks first to avoid procrastination.

4. Set specific goals for each day and track your progress. Celebrate small achievements to stay motivated.

5. Use timers or alarms to help you stay on track and avoid getting lost in distractions.

6. Create a daily routine and stick to it as much as possible. Having a structured schedule can help you stay organized and manage your time effectively.

7. Consider using tools and apps designed for task management and

```
productivity, such as time tracking apps, reminder apps, and
organization tools.

8. Remember to take breaks when needed to recharge and avoid burnout.
It's important to listen to your body and mind to maintain
productivity.

Remember that everyone is different, so it may take some trial and
error to find the strategies that work best for you. Don't be too hard
on yourself if you have setbacks — just keep trying and adjusting your
approach as needed.
-------------------------------------------------------------
AFTER:
One helpful strategy is to break tasks into smaller, more manageable
chunks. Use timers or the Pomodoro technique to work in short, focused
bursts with built-in breaks. Prioritize tasks and use tools like to-do
lists or an electronic calendar to keep track of deadlines. Setting up
a daily routine can also help create structure in your day.
=============================================================

Question 3: I keep forgetting important tasks, any tips?
-------------------------------------------------------------
BEFORE:
Sure! Here are some tips that may help you remember important tasks:

1. Use a planner or digital calendar to keep track of deadlines and
commitments.
2. Set reminders on your phone or computer for important tasks.
3. Break down larger tasks into smaller, more manageable steps.
4. Use sticky notes or visual reminders in your work space.
5. Establish a routine for daily tasks to create consistency.
6. Prioritize tasks and focus on one thing at a time.
7. Consider using time management techniques such as the Pomodoro
Technique or time-blocking.
8. Practice mindfulness and stay present in the moment to help improve
focus and memory.
9. Make use of ADHD-friendly apps and tools designed to help with
organization and time management.
10. Seek support from a therapist, coach, or support group to learn
strategies and coping mechanisms for managing ADHD symptoms.
-------------------------------------------------------------
AFTER:
Setting up reminders on your phone or computer can be really helpful.
You can also try breaking tasks into smaller steps or writing things
down in a planner or to-do list.

```
print_summary(metrics)

=== Metrics Summary ===
Final training loss:       0.0056
Final training accuracy:   1.0000
```

Observations

As seen with every epoch teh loss is decreasing. I wouldnt lean too much into the accuracy.

Final Notes

It is important to emphasize on below

```
                        Prompt Experiment Types vs Prompting in
Generative AI
```

Prompt Experimentation Prompt experimentation is the systematic process of testing and varying prompt components to measure their effect on model output quality. It treats prompting as an empirical discipline — changing one variable at a time, such as phrasing, examples, temperature, or instruction specificity, and observing how outputs shift. Experiments might test whether adding "think step by step" improves reasoning accuracy, whether a system prompt outperforms a user-turn instruction, or whether few-shot examples reduce hallucination rates. The goal is not just a good output, but knowledge about which prompt design reliably produces good outputs across varied inputs. In production AI systems, this methodology separates robust pipelines from brittle ones.

Prompting Prompting is the practice of crafting input text to guide a generative AI model toward a desired output. Techniques include zero-shot prompting, which provides no examples; few-shot prompting, which embeds input-output examples directly in the prompt; chain-of-thought prompting, which instructs the model to reason step by step; and role prompting, which assigns a persona to shape tone and expertise. Prompting is the primary interface between humans and LLMs, and its effectiveness depends on structure, context, and intent.

Nice to explore in future

1. Synthetic generation of prompt experiments using a different LLM
2. Evaluation metrics to understand what happens when prompts change
3. What pretraining is and how it fits into your data
4. What LLM as judge means and how it fits after fine tuning
